1 Introduction

In the context of the DBA program at Vlerick Business School a literature review is one of two deliverables of year two. The research topic is “BPM for regulatory compliance”. The goal of this review is to get an overview of relevant literature and identify topics listed as possibilities for future research. The type of literature review is a systematic literature review (SLR). The SLR has been performed following the steps described in Kitchenham and Charters (2007).

Chapter 2 states the main research question, three subquestions and provides for a definition of the central concepts.

Chapter 3 is about the planning of the research. It describes the databases that were searched, the search terms used, the criteria for selecting articles and how the bibliographic data and the articles have been obtained.

Chapter 4 concerns the execution of the research. It describes the studies found, which studies have been selected, how the quality of the studies has been assessed, how the data was collected and a synthesis of the data.

Chapter 5 concerns the reporting of the research. It describes how the results of this study will be shared, limitations of the study and possibilities for further research suggesting possible improvements.

2 Research question(s)

The research question (RQ) and the three supporting sub-questions (SQ) that are addressed in this literature review are:

RQ: What are approaches for aligning business processes with regulatory requirements to achieve regulatory compliance by design?

SQ1: How can businesses identify relevant regulatory requirements?

SQ2: How can businesses analyze which business processes are affected by changes in regulatory requirements?

SQ3: How can businesses integrate compliance requirements into business process design?

The focus of this review is specifically the first question (RQ). The following is the research question repeated whereby the central terms and concepts in this review are boxed: What are approaches for aligning business processes with regulatory requirements to achieve regulatory compliance by design?

compliance by design

A definition of the three central concepts:

Business process management (BPM) is defined as all activities performed by businesses to discover, model, automate, analyze, measure, improve and optimize business processes (Liu, Müller, and Xu 2007). A business process coordinates the behavior of people, systems, information and things to produce business outcomes in support of a business strategy. Processes can be structured and repeatable, or unstructured and variable.

Regulatory compliance is defined as ensuring that business processes, operations, and practices are in accordance with a prescribed and/or agreed set of norms. These compliance requirements may stem from legislature and regulatory bodies (e.g., Sarbanes-Oxley, Basel II, HIPAA), standards and codes of practice (e.g., SCOR, ISO9000), and also business partner contracts (Hashmi (2015)).

Compliance by design refers to approaches and methodologies where compliance requirements are integrated into business process models and enterprise applications from the very beginning (Sadiq and Governatori 2010). This concept emphasizes embedding compliance within the fabric of business practices rather than treating it as a separate or after-the-fact activity [IohmannComplianceDesignArtifactcentric2013].

3 Review plan

3.1 Resources to be searched

An initial set of databases was selected to perform the literature search on. Both commercial and open access databases have been selected. A description for these databases is included in table A.1.

1. Web of Science (WoS), Publisher: [Clarivate](#)
2. ScienceDirect (SD), Publisher: [Elsevier](#)
3. SSNR, Publisher: [Elsevier](#)
4. arXiv, Publisher: [cs](#)
5. dblp, Publisher: [dblp](#)
6. Zenodo, Publisher: [Zenodo](#)

As a test we performed some initial searches. The results of the initial searches were reviewed. SSNR and Zenodo yielded few results as compared to the other databases. The selection of databases was reduced to WoS, SD, SSNR, ArXiv and dblp.

3.2 Search terms used

The initial search terms have been formulated as follows:

1. (“business process management” or BPM) and “regulatory compliance”
2. (“business process management” or BPM) and “legal compliance”
3. (“business process management” or BPM) and “compliance”
4. “business process management” and (“regulation” or “regulatory”)
5. “business process *engineering” and “compliance”
6. “business process *engineering” and (“regulation” or “regulatory”)

Here too a test has been performed using the search terms. It was found that the combination of “business process management” with “regulatory compliance” or “legal compliance” yielded few results. Consequently, 1 and 2 were skipped. We searched for “business process management” and “compliance” which includes both “regulatory compliance” and “legal compliance”.

3.3 Study selection criteria

The quality of an article is assessed on the basis of the 4 criteria(QA1 through QA4). The criteria are equally weighted. An article is assigned 1 point for every QA criterium that is met. An article will thus get score of 0 through 4. Other metrics like author h-index and journal impact factor will not be considered in the selection process.

Table 3.1: Study selection criteria

criteria	code	descriptions
inclusion	IC1	the title, abstract and full text are in english
	IC2	the publication is dated between 2000 and 2024
exclusion	EC1	the reference is to a book(chapter)
	EC2	the article has been retracted
	EC3	the type of article is a conference paper or a preprint
	EC4	a search term has a different meaning
	EC5	the application relates to a specific sector
	EC6	the title, abstract and full text are not in english
quality	QA1	the article is a peer-reviewed journal article
	QA2	the article appeared in one of the legible journals
	QA3	has a citation count higher than 5 per year since the year of publication
	QA4	the first and second author have combined more than 50 publications listed on google scholar

3.4 Data extraction strategy

The initial 6 data sources have been reduced to 4 (excluding Zenodo). For the remaining 5 data-sources queries will be formulated for each data source. The resulting records found will be listed in an excel file “slr_logbook.xlsx”.

4 Review execution

4.1 Research identification

Initially 6 queries have been run against the 6 databases resulting in 84 hits as shown in table 4.1 in appendix D. After testing the initially formulated 6 queries have been reduced to 4 queries. The first two queries search for “business process management” or BPM in the title. The last two queries search for “business process engineering” or business process reengineering” in the title.

1. TI=(“business process management” or BPM) AND (AB=(compliance) OR KP=(compliance))
2. TI=(“business process management” or BPM) AND (AB=(“regulat*”) OR KP=(“regulat*”))
3. TI=(“business process *engineering”) AND (AB=(compliance) OR KP=(compliance))
4. TI=(“business process *engineering”) AND (AB=(regulat*) OR KP=(regulat*))

The initial list (table D.1) contains a total of 84 records. An additional 6 records were found from other sources (table D.2). The total is 90 records. This list includes preprints and conference papers. Filtering the journal articles results in a list of 25 records (table D.3).

In the case of Web of Science (WoS) the four queries have been taken together using the “OR” operator. This final query yields 42 results when using the the Vlerick WoS subscription¹. The search strings have been adapted to suit the specific requirements of the databases.

4.2 Selection of studies

The initial searches were done on all database fields. The search was subsequently made more specific by searching titles and abstracts. Lastly we searched titles, abstracts and keywords.

Across the 6 databases 84 articles have been identified, and an additional 6 records have been added from different sources. The found records are listed in Appendix D: table D.1 and table D.2.

The process to get to the final 23 papers included in this literature study is visualized in the flowchart in Appendix C.

The WoS search yielded 29 hits. Excluding 4 articles with BPM in the title where BPM has a different meaning than “Business Process Management”. For example where BPM is an abbreviation of “Biodiesel Particulate Matter”. Excluding 1 article as it is a double, also occurring in the dblp search.

¹Web of Science: Core Collection
Subscription : Vlerick Business School
Editions : A&HCI , ESCI , CPCI-SSH , CPCI-S , SCI-EXPANDED , SSCI
Date range: 2014-2024

The ACM search ...

The SD search yielded 7 hits. On the basis of article type (1 book chapter and 1 short communication) we have excluded two articles. An additional article was excluded as the title referred to “Business Process Management Map”, which is a different concept.

The SSRN search yielded 2 results, both excluded as they are preprints.

The arXiv search yielded 0 records when looking for articles with “Business Process Management” or BPM in the title field. Two records were found on the basis of abstract and keyword matches. All the same these records have been subsequently excluded when the exclusion criteria have been applied.

The dblp search yielded 41 records, including 2 books and 35 conference papers. After exclusion 4 records remain, 3 journal articles and one PhD thesis. For the next step, the abstract scan, the thesis has been replaced by a journal article by the same author about the same topic.

The Zenodo search yielded 0 records when looking for articles with “Business Process Management” or BPM in the title field.

Six additional records have been included identified via different sources: 4 journal articles, 1 PhD thesis and 1 conference paper. Here too, for the next step in the process the thesis has been replaced by a journal article by the same author about the same topic.

In summary:

Table 4.1: Result set

Database	Found	Additional	Subtotal	Excluded	Result set
WoS	29		29	-19	10
ACM					
SD	7		7	-7	0
SSRN	0	+2	2	-2	0
arXiv	0	+4	4	-4	0
dblp	42		42	-37	5
zenodo	0				0
additional	0	+6	6		6
total	78	+12	90	-69	21

The abstracts of the remaining 21 articles are listed in “Abstracts”, table [D.3](#).

4.3 Study Quality Assessment

The first quality indicator is about the type of journal. Peer reviewed articles are deemed to be of better quality than, for example, conference papers. The second quality indicator is an indirect measure of both the quality of the journal and the relevance of the article to the Information Systems

field. The third quality indicator is a proxy for the quality of the article. The fourth indicator is deemed to be representative for the quality of the scholars.

The outcome for QA1 through QA4 is either 1 or 0 (1 means yes, 0 means no).

QA1: the article is of the type peer-reviewed journal article

QA2: the journal is in the eligible journals list

QA3: the article has been referenced an average of 5 times per year since publication

QA4: author 1 and author 2 have together authored at least 50 articles

The detail of the calculation for QA3 en QA4 is shown in [appendix E](#).

Table 4.2: Quality assessment

Seq	Source	QA1	QA2	QA3	QA4	Score
1	WoS_02	1	0	0	0	1
2	WoS_03	1	0	0	1	2
3	WoS_04	1	0	1	1	3
4	WoS_05	1	0	0	1	2
5	WoS_06	1	1	0	1	3
6	WoS_10	1	0	1	1	3
7	WoS_14	1	0	1	1	3
8	WoS_15	1	0	1	1	3
9	WoS_16	1	0	0	1	2
10	WoS_17	1	0	0	0	1
11	dblp_01	1	0	0	1	2
12	dblp_03	1	0	1	1	3
13	dblp_08	1	0	0	0	1
14	dblp_13	1	0	0	1	2
15	dblp_28	0	0	0	0	0
16	other_01	1	0	1	0	2
17	other_02	1	0	0	1	2
18	other_03	1	0	1	1	3
19	other_04	1	0	1	1	3
20	other_05	0	0	0	1	1
21	other_06	1	0	1	1	3

For the final list we only consider the 9 articles where three or more conditions are met (see: [appendix E](#), table D.4).

4.4 Data collection

The output of each query has either been a bib file or a ris file. All bib files have been converted to ris files. The mapping of bibliographic elements to the ris fields differs per data sources. A script has been written to get to a uniform ris-format.

The open access databases do not contain the full text articles if the articles are not open access. DBLP also doesn't contain abstracts. The absence of full text articles or abstracts is explained by constraints imposed by copyrights.

The excel file containing the article lists has been stored on zenodo for future reference ([zenodo 10795823](https://zenodo.org/record/10795823)).

4.5 Synthesis of extracted data

8-12 years ago: the two oldest papers in the dataset are Vanderfeesten, Reijers, and Van Der Aalst (2011) and Hadasch, Maedche, and Gregor (2016). The article of Irene Vanderfeesten is on the subject of her PhD thesis (Vanderfeesten, Reijers, and Van Der Aalst (2011)). It describes the concept of a Product Data Model which, in workflow systems, can be compared to a Bill of Material in manufacturing systems. The article doesn't mention future research but does mention collaboration with industrial partners to incorporate a PDM in a commercial tool. The Hadasch paper is a quantitative study about users' process compliance as a function of process explanations either in textual or diagram format (DE/DDE). Broadly stated, the paper concludes that the better explanations result in better compliance. Other than a recommendation that the findings of the paper be leveraged in future research, there is no specific guidance about future research.

4-8 years ago: the four papers published in the 2016-2019 timeslot are Van Der Aalst (2018), Hashmi and Governatori (2017), Hashmi et al. (2018) and van der Aa, Leopold, and Reijers (2017). The van der Aalst paper compares and contrasts spreadsheet technology with process mining technology. It mentions checking for compliance as the activity whereby a process as run in reality is compared to a normative model. The article mentions future process mining research should be about automatically improving processes by changing underlying process models. The first Hashmi paper compares six Compliance Modeling Frameworks (CMFs). There are two pointers to future research directions. 1) Studying the formal semantics of the norms modeling languages. 2) Studying the useability of the norms modeling constructs in practice. The second Hashmi paper is a SLR where 79 papers were included in the study. The study provides a comprehensive overview of the attributes of compliance in BPM. There is a general direction for future research given: to improve modeling languages to take into account all compliance requirements. The article by van der Aa et al. is about the possible divergence of process descriptions and graphical process models. A quantitative analysis is performed on 53 real-life model-text pairs. One of the suggested future research directions is to also capture process information in other formats. Among the examples given of such other formats are rules and regulations.

0-4 years ago: the three most recent papers in the set are the papers and Kir and Erdogan (2021), Bernardo Junior and De Padua (2023) and Viriyasitavat et al. (2023). The Kir paper introduces *agileBPM*, a modeling methodology. The main differentiator is that next to control flow *agileBPM* also captures knowledge, rules and goals. A prototype of the system is compared to other similar systems (ADEPT, SmartPM, Planlets, Go4Flex). The paper doesn't mention future research. The Bernardo paper includes a SLR, interviews and expert consultations. Agile BPM is defined. Future research is suggested to be on practices necessary for empirical application of BPM in organizations. The Viriyasitavat article is a SLR on the use of blockchain technology for business process compliance. The paper argues that blockchain technologies can and are applied for business process compliance.

Existing work has a focus on technical implementation of the functionalities of traditional BPM systems. However the use of blockchain technologies also allows for new functionalities. The further research section specifically mentions organizational and legal aspects.

Table 4.3: Relevance to research question

	Year	Article	Alignment Concepts	Future Research
1	2011	Vanderfeesten et al.	ProductData Model	N
2	2016	Hadasch et al.	(Diagram)Descriptive Explanations	N
3	2017	Van der Aa et al.	Consistency between representation	Y (specific)
4	2018	Van Der Aalst	Prescriptive Analytics	Y (general)
5	2018	Hashmi et al.	Compliance Modeling Frameworks	Y (specific)
6	2018	Hashmi et al.	Compliance Modeling Languages	Y (general)
7	2021	Kir et al.	Context Awareness / Norm adoption	N
8	2023	Viriyasitavat et al.	Blockchain	Y (general)
9	2023	Bernardo Junior et al.	-	Y (general)

All papers mention approaches for alignment of business processes with regulatory requirements except the Bernardo Junior paper about agile BPM.

From these 9 papers reviewed, 6 mention future research directions. Two papers mention specific future research topic, for example around “consistency between different process representations” and “the useability of norm modelling constructs”.

Summary of the Related Work

Business process modelling (BPM) and business process simulation (BPS) help to facilitate process thinking. (Barber et. al., 2003) suggest a practical way forward until hardware and software limitations are overcome. As enterprises increasingly use business process management systems to automate their business processes, technologies to automatically check the compliance of process models against compliance rules are becoming important. (Liu et. al., 2007) present a method to improve the reliability and minimize the risk of failure of business process management systems from a compliance perspective. This is because, especially with regulatory compliance, both business and government have to expect large financial and reputational losses if compliance cannot be ensured and demonstrated. (Lang et. al., 2008) illustrate the theory behind Model Driven Security for compliance, provide an improved and extended architecture, as well as a case study in the health-care industry using the OpenPMF 2.0 technology. Regulatory compliance of business operations and practices is increasingly becoming an area of great concern for management, costing tens of billions of dollars in compliance actions a year. (Araujo et. al., 2010) present a method for validating business processes with respect to the business rules. In the discipline of business process management in particular, compliance is considered as an important driver of the efficiency, reliability and market value of companies. For this purpose (Kharbili et. al., 2011) contribute CoReL, a domain-specific modeling language for representing compliance requirements that has a graphical concrete syntax. Legal Knowledge Management systems that combine repositories of legislation with legal ontologies can support the work of in-house compliance managers. (Boella et. al., 2013) extend the Legal Knowledge Management system Eunomos to deal with alternative interpretations of norms connecting it with Business Process Management systems. (Elgammal et. al., 2014) propose a semantically-enabled compliance management framework. In the heart of the framework is an integrated semantic repository incorporating regulatory, business and compliance knowledge; i.e., CMKB. (Sadiq et. al., 2015) present an overarching methodology for aligning business and control objectives. The chapter concludes with a discussion on the role of BPM as a driver for regulatory compliance and a presentation of open questions and challenges. In the business process compliance management literature, (Delfmann et. al., 2015) find an abundance of approaches supporting business process compliance checking. With this objective of (Delfmann et. al., 2015) at making a step towards comprehensive catalogues of compliance rules that can be used as input for business process compliance checking approaches. By definition, regulatory rules (in legal context called norms) intend to achieve specific behaviour from business processes, and might be relevant to the whole or part of a business process. (Hashmi et. al., 2016) present an abstract framework consisting of a list of norms and a generic compliance checking approach on the idea of (possible) execution of processes.

5 Review reporting

5.1 Dissemination strategy

A subsequent version of this review will be part of the PhD work. The aim is to get three by-products out of this review:

- A poster that explains this literature review process and its results to be presented on a research day.
- A version of the software script that is installable and useable by somebody else.
- An open access publication.

5.2 Limitations

The database searches resulted in a set of relevant articles for the subject of this review. Selecting a different set of databases would have resulted in a different set of relevant articles. The selection of databases was made from the databases available to us. We did not consider databases that require additional payment for access.

It is also noted that search results may differ among different databases. If the content of two databases is identical, the same query run against both databases can yield different results. The differences stem, among others, from different search fields, different query languages, different API's and different search engines. Examples of notable differences are:

- for WoS: the search results may differ depending on the subscription that is available to the user.
- for SD: the search results may differ as query's are interpreted based on language heuristics ([source](#)). Also, SD does not support wildcards.
- for dblp: the *CompleteSearch* engine autocompletes search terms, see Bast and Weber (2006).
- for arXiv: wildcards can not be used as the first character of a search term ([source](#)). For example “*engineering” will trigger an error message.

To assess the quality of the 21 identified articles a set of 4 indicators has been considered. There are many other indicators which can be used to assess the quality of an article. Changing the number of indicators and/or changing the selection of parameters could alter which full text articles are selected for the review.

5.3 Future research

In follow-on research it may be interesting to include openAIRE (Open Access Infrastructure for Research in Europe) as a data source. Schumm et al. (2010), p. 11 reference research that has been performed under the 2008-2011 COMPAS research project funded by the EU and coordinated by the Technische Universität Wien. More information about the research output of these projects will be available via OpenAIRE. When OpenAIRE will be included as a data source we will also again include Zenodo. Zenodo was created as part of the OpenAIRE initiative.

For reproducibility a future version of this literature review shall have the protocol altered. For commercial databases one and the same query can yield different results if it is run with two different licenses. This has been found to be the case with Web of Science. For the query used in this review the Vlerick Business School license of WoS yielded 42 hits while the Amsterdam University of Applied Sciences license of WoS yielded 24 hits (to be included in appendix). It is assumed the average user does not have precise information of the licenses that Academic institutions hold. As such WoS is better not used in the early stages of the search. The protocol could instead dictate the use of open databases, such as OpenAlex, for the early stages of the search. Commercial databases would then be used in a later stage to get abstracts and full texts of selected articles that are not available from open databases.

For quality assessment we have now used a self-constructed indicator (QA4) that has as inputs the number of publications by the first and second author. If further research is conducted it can be considered to replace this indicator with the ubiquitous h-index (Poirrier, Moreno, and Huerta-Canepa (2021)). Also, the fact that only 1 article is from the eligible journals list seems to indicate that either the list needs to be revised. Alternatively a different indicator, such as the journal impact factor, can be a substitute quality indicator.

Finally, where it relates to compliance checks, in the literature there is a divide between “design time” and “run time”. As the RQ of this research refers to compliance by design, future research may have more of different search terms to also filter research about “design time” compliance checking.

A Databases Searched

Table A.1: Databases consulted

Platform	Type	Focus	Coverage	Access
Web of Science	Citation index	Wide range of disciplines (including hard sciences, social sciences, and the humanities)	Over 18,000 academic journals, books, patents, and other scholarly publications	Subscription-based
ScienceDirect	Academic literature platform	Science, technology, medicine, and social science	Over 3,500 peer-reviewed journals	Subscription-based and open access
ACM	Digital Library	Computing and information technology	Full-text articles from ACM journals and conference proceedings	Subscription-based and open access?
SSRN	Preprints	Social sciences, economics, and business	Early-stage social science, economics, and business research papers	Open access
arXiv	Preprints	Hard sciences and quantitative sciences	Early-stage research papers in a wide range of disciplines	Open access
DBLP	Bibliography database	Computer science	Scholarly publications in computer science	Open access
Zenodo	Dataset repository	Data from various disciplines	Data from research projects, surveys, and other data collection efforts	Open access

Table A.2: Other resources - not consulted

Platform	Operator	Note
Scopus	Elsevier	not available via Vlerick
OpenAlex ¹	OpenAlex	
OpenAIRE	OpenAIRE	Mentioned in connection with Zenodo and also EU Research Programs
CEUR Workshop Proceedings		

¹For a description of OpenAlex see Priem, Piwowar, and Orr (2022).

B List of eligible journals

The columns: level and impact factor (IF) are taken from the Vlerick Strategic Journal List (the List), effective as of January 2020. Empty means the journal is not on the List.

Table B.1: Basket of 11

Journal Title	Level	IF
MIS Quarterly (MISQ)	A*	7,268
Journal of Management Information Systems (JMIS)	A*	2,744
Information Systems Journal (ISJ)	A	4,267
Journal of the Association for Information Systems (JAIS)	A	2,839
Communications of the Association for Information Systems (CAIS)	A	?
Information Systems Research (ISR)	A*	2,301
Journal of Information Technology (JIT)	A	4,435
European Journal of Information Systems (EJIS)	A	2,819
Decision Support Systems (DSS)	A	2,819
Information & Management (IAM)	A	3,890
Information and Organization (IAO)		

Next to the basket of 11 there are other journals that are of interest. BISE is of interest because it is an european (IS) journal (as is EJIS). BPMJ and IJDG may be of interest given the subject matter their titles refer to.

Table B.2: Other journals of interest

Journal Title	Level	IF
Business Process Management Journal (BPMJ)		
Business & Information Systems Engineering (BISE)		
Journal of Disclosure and Governance (IJDG)		

C Literature Selection

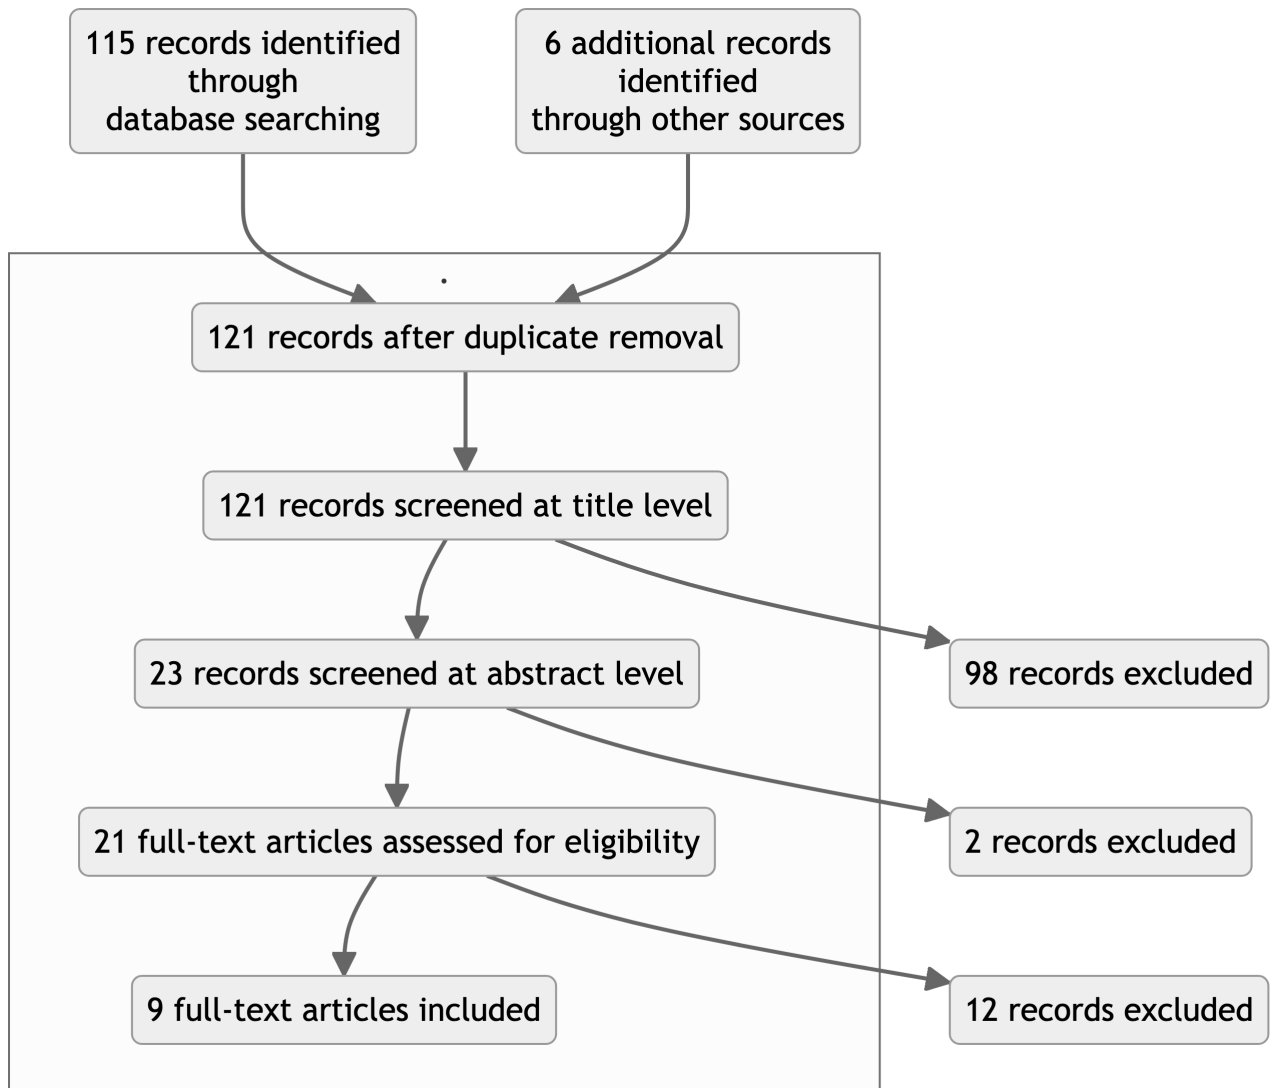

Figure C.1: Flowchart depicting literature selection.

D Literature Identified

The tables below show records found. Seq (sequence) shows a table row number. Source shows the data source where the record was found. Type holds the type of publication (conference proceedings, journal article, preprint, etc.) Title is the title of the publication. EC (exclusion criterion) shows the reason a record is excluded. If a record is excluded for multiple reasons, only one reason is shown. QA (quality assessment) shows the QA-score the record obtained (0-4).

Table D.1: Identified through database searching

Seq	Source	Type	Title	EC

E Quality Criteria

Indicator QA3

The table shows the inputs for calculating the QA3-score. The score is 1 if the outcome of the calculation is larger than or equal to 5, otherwise it is 0. The calculation is: $\text{cited/year} = \text{number of citations} / (2024 - \text{Publication Year})$.

Indicator QA4

The table shows the inputs for calculating the QA4-score. The score is 1 if the outcome of the calculation is larger than or equal to 100, otherwise it is 0. The columns 'First Author' and 'Second Author' hold the number of articles by these authors on google Scholar.

Table E.1: Calculation of the QA3-score and QA4-score

Seq	Id	Citations	Year	Cited/Year	QA3-Score	First Author	Second Author	Total Articles	QA4-Score
1	WoS_02	4	2022	2	0	92	0	92	0
2	WoS_03	5	2015	0.6	0	145	0	145	1
3	WoS_04	333	2020	83.3	1	92	374	466	1
4	WoS_05	10	2019	2	0	0	134	134	1
5	WoS_06	12	2016	1.5	0	0	557	557	1
6	WoS_10	78	2021	26	1	9	99	108	1
7	WoS_14	5	2023	5	1	51	83	134	1
8	WoS_15	38	2018	6.3	1	1881	-	1881	1
9	WoS_16	8	2020	2	0	0	322	322	1
10	WoS_17	5	2014	0.5	0	0	0	0	0
11	dblp_01	4	2022	2	0	35	122	157	1
12	dblp_03	32	2018	5.3	1	46	416	462	1
13	dblp_08	8	2017	1.1	0	0	22	22	0
14	dblp_13	8	2013	0.7	0	14	93	107	1
15	dblp_28	36	2010	2.6	0	90	0	90	0
16	other_01	5	2023	5	1	0	46	46	0
17	other_02	10	2021	3.3	0	0	192	192	1
18	other_03	149	2018	24.8	1	46	416	462	1
19	other_04	70	2017	10	1	95	151	246	1
20	other_05	23	2013	2.1	0	11	189	200	1
21	other_06	110	2011	8.5	1	121	514	635	1

Meaning of the column names:

- Citations : the number of citations on google scholar
- Year : Year of Publication
- First author : the number of publications by the first author on google scholar
- Second author : the number of publications by the second author on google scholar
